

ABSTRACT

The present invention is directed to an improved handle, which is equipped on a hand tool, that provides a secure grip and reduces stress on a user's hand by providing a recessed surface area on a side of the handle for receiving a thumb, and a multi-ridged surface area on a side opposing the recessed surface area, the multi-ridged surface area providing at least two
5 ridges that intercalate between an index finger and a middle finger and between a middle finger and a ring finger.
